

RAINBOW TOPOLOGY

Joint Inspection Frame

A bounded proposal for placing Ricky's governed inspection route on Sandra's stated floor, then observing both together without merger, inversion or custody transfer. Prepared as a read-only research-support copy for Max.

DRAFT FOR SANDRA'S
CONFIRMATION

MAX: READ-ONLY SUPPORT

NO EXECUTION AUTHORITY

The direction invariant

The floor is not inspected through the runtime. The floor is fixed first; a runtime is placed on it; the behaviour of both is observed. Reversing that arrow is outside the object.

Control	Bound state
Version	v0.1 - prepared 18 August 2026 (UTC)
State	PREPARED / NOT APPROVED / NOT RUN
Inheritance disposition	LOCAL
Package complete	NO - Sandra's confirmation and exact source freeze are outstanding
Authority	Ricky authorises preparation of this frame only; Sandra retains approval of the joint starting conditions; Max supplies research support only
Claim boundary	Experimental architecture proposal. No causal, mathematical, scientific, authorship or validation claim is made.

ONE-SENTENCE OBJECT

Test whether a source-preserving, governed runtime can be placed on Sandra's stated non-causal floor to inspect continuity, propagation and change across one bounded trajectory without absorption, causal storytelling or architectural merger.

STOP ON THIS PAGE

This document prepares the frame. It does not begin the experiment, inspect Sandra's floor, enrol any person, or approve a shared result. Max may inspect the proposal and return research support, but supplies no authority or custody.

1. Shape before action

The proposed joint object

Layer	Function in this object	Custody / authority
Floor	Sandra's non-causal predicate over whole trajectories, as Sandra defines and sources it. It supplies the ground condition; it is not graded by the runtime.	Sandra: definition, source selection, interpretation and approval.
Runtime	Ricky's governed inspection route: object lock, source binding, version control, permission, stop-rights, receipts and return.	Ricky: runtime design, execution boundary and inspection receipts.
Rainbow specimen	One frozen, timestamped trajectory or trace-set chosen jointly to make continuity, deviation, propagation and transformation inspectable.	Joint selection; original source custody remains where it began.
Observation	A layered record of what the floor admits, what the runtime permits or stops, and what changes across the specimen.	Shared only to the extent explicitly agreed in the frame.

No inversion

The runtime may govern its own handling of the experiment. It may not present itself as the authority that establishes, validates or overrules the floor.

WORKING RESEARCH QUESTION

When a whole-trajectory predicate is held as the floor, can a governed runtime preserve source, track controlled transformation, and expose deviations without converting the trajectory into a causal chain or absorbing one architecture into the other?

EARLY CLAIM STATUS

The question is admissible as a proposal. Any answer is UNKNOWN until the source objects are frozen, the specimen is agreed, the run occurs, and both parties review the record.

2. Boundaries and exclusions

What cannot enter

Boundary	Fixed treatment
Richard	Outside the Rainbow object and outside anything Ricky and Sandra do together, in any role, as Sandra's stated fixed condition.
NC2.5	Outside this object and left intact. No import, test, comparison, mutation or implied participation.
Original admissibility / floor	Remains Sandra's from the start and without exception. It is not offered for joint ownership, runtime judgement or renegotiation.
Trinity / governed route	Remains Ricky's runtime lane. Its use here does not transfer ownership, authority or authorship.
Architectures	No merger, absorption, replacement, hierarchy or claim that the two works are the same thing.
Corpus	No full-corpus intake. Only the exact public pair and any further source Sandra expressly selects for this object.
Causality	No causal inference from sequence, recurrence, timing, similarity, propagation or deviation.
Public meaning	No public claim, launch, partnership announcement, endorsement or recruitment follows from preparing or approving the frame.

RAINBOW NAME BOUNDARY

'Rainbow Topology' is Ricky's working name for the bounded observation idea. Unless formal definitions and proofs are later supplied and agreed, topology is not used here as a claim of established mathematical topology.

Failure condition

If the arrow reverses; either architecture is asked to validate the other; custody blurs; an excluded person or system enters; or a pattern is upgraded into proof, the run stops and no result is admitted.

3. Contribution and custody ledger

Credit without absorption

Contributor	Contribution proposed	What this does not transfer
Sandra	The floor; exact predicate definition; selected source works; conditions under which the floor is being used; approval or correction of this frame.	No transfer of the predicate, corpus, original admissibility, authorship or interpretive authority.
Ricky	Rainbow proposal; governed inspection route; source-preservation and trajectory-record method; runtime receipts and stop conditions.	No transfer of TrinityOS/RickyOS architecture, runtime governance or authorship.
Joint	Only the agreed specimen, questions, observation session and any deliberately co-authored result note.	No automatic partnership, merged architecture, co-authorship of prior work or continuing authority.

SOURCE PAIR NAMED BY SANDRA

Source	Role in this frame	Inspection state
Non-Causal Non-Causality	Formal source named by Sandra for the floor.	Link supplied; not summarised, evaluated or absorbed in this draft.
Reality Catches the Predicate	Human bridge named by Sandra for the same floor.	Link supplied; not summarised, evaluated or absorbed in this draft.

<https://petronus.eu/blog/non-causal-non-causality/>
<https://petronus.eu/blog/reality-catches-the-predicate/>

SOURCE STATUS

Sandra states that the predicate runs through her public, dated and hashed corpus from October 2025. This frame records that statement as Sandra's provenance claim; it does not independently verify the corpus, dates, signatures or hashes.

ACCOUNTING RULE

Every later output must identify the source object, speaker, exact contribution, version, custody, transformation and claim status. Similarity, adjacency and usefulness do not create ownership or shared authorship.

4. Proposed bounded run

One specimen, one pass, one stop

Stage	Required move	Gate / receipt
1. Confirm frame	Sandra confirms, corrects or rejects this v0.1 frame.	No confirmation = HOLD.
2. Freeze inputs	Record exact titles, versions, dates, hashes where available, and the selected specimen.	Any source change reopens the binding.
3. Pre-register	Agree the observable fields: source, state, time, relation, deviation, transformation, preservation, runtime decision and uncertainty.	No new field after results are seen without marking it post hoc.
4. Place runtime	Stand Ricky's governed route on the agreed floor; do not use it to assess the floor itself.	Direction check immediately before run.
5. Observe	Run one bounded specimen through one pass. Preserve ALLOW, HOLD, DENY, unknowns and negative findings.	No alternative route; stop-right remains live.
6. Separate layers	Return floor observation, runtime behaviour and Rainbow trajectory record as distinguishable layers.	No blended verdict.
7. Joint review	Each party checks attribution, custody, interpretation and whether any conclusion exceeds the run.	Disagreement remains visible; silence is not approval.
8. Close	Issue a short receipt naming what was learned and what was not established.	One run does not authorise another.

MINIMUM OUTPUT PACK

1. Source-and-version register. 2. Agreed specimen card. 3. Runtime decision receipt. 4. Trajectory/deviation map. 5. Layered joint observation note. 6. Negative-space receipt.

Stop-right

Either party may stop the run before consequence. Stopping preserves the record to that point; it does not imply failure, concession or permission to continue elsewhere.

5. Approval surface

What Sandra is being asked to confirm

This is the only live next move. Content work begins only after the frame is confirmed.

Confirmation point	Sandra's response
Direction	The floor comes first; the runtime is placed on it; both are observed together. YES / NO / CORRECT
Exclusions	Richard and NC2.5 remain outside and intact. YES / NO / CORRECT
Custody	The floor and original admissibility remain Sandra's; the governed runtime remains Ricky's. YES / NO / CORRECT
Contribution ledger	Prior work stays with its author; only explicitly joint output is joint. YES / NO / CORRECT
Rainbow object	One frozen specimen; one bounded pass; no causal or merger claim. YES / NO / CORRECT
Source intake	The named pair orient the floor; exact versions must be frozen before use. YES / NO / CORRECT

Proposed approval line

I confirm this frame as the starting boundary for one bounded Rainbow inspection object, subject to the corrections I mark here. Confirmation authorises framing only; execution requires the frozen inputs and a separate live ALLOW.

OBJECT:

Rainbow Topology joint inspection frame v0.1

STATE:

Prepared for Max's read-only research support; awaiting Sandra's confirmation

NEXT:

Max may return bounded research support; Sandra confirms, corrects or rejects the frame

STOP:

No source intake, runtime execution, public statement or joint result before confirmation and a separate live execution authority

PACKAGE COMPLETE:

NO
